

Concrete Geoslabs

Flexible concrete slab GEOSOTY™

Flexible concrete slab GEOSOTY™ is designed for protection of building structures (oil and gas pipelines, hydraulic structures and bank slopes) in oil and gas, transport and other construction industries. Flexible concrete slab GEOSOTY™ combines such qualities as flexibility and resistibility. This makes it possible to use the bay for reinforcement of camber surfaces as well as in complex permafrost conditions. Additional reinforcement with the use of a polyamide cord allows construction strengthening as well as guarantees strapping and binding of the slab.
