

ANNOUNCING THE ARRIVAL OF MCU-COATINGS

We are proud to announce that MCU-Coatings has arrived in Australia and New Zealand.

Moisture cured urethane protective coatings have been around for over 30 years. The first major coatings project to be completed with moisture cured urethanes was the Astoria Megler Bridge in Oregon, back in 1987. In 2006 tests were carried out that confirmed the original moisture cured urethane system they applied back then was the only coating ever trialled on the bridge that achieved a SSPC Corrosion rating of 10 - less than 0.01% corrosion creep – even after all that time. The bridge is therefore featured on the front cover of the accompanying Capability Statement.

MCU formulations have only improved since that bridge was coated because, after acquiring their original formulations in 2000, the owners of MCU-Coatings International retained the inventor of the technology as a silent partner and together they have continued to upgrade and improve their formulations, to the point now where recent independent testing has confirmed MCU-Coatings are now redefining industry expectations:

In 2019 MCU-Coatings was acclaimed as the only paint producer worldwide to have achieved a "25+ years to first maintenance durability" approval in accordance with internationally accepted ISO test standards based on a 2-coat, 260µm DFT coating applied on weathered steel plates with a ST3 surface preparation.

Numerous other, independent, laboratory tests have also been completed in accordance with: • ISO; • SHELL; and • NORSOK test standards and one MCU product has even survived 20,000 hours of salt spray testing!

Our development plan in Australia/NZ region at this early stage is to import product directly from Europe to meet confirmed orders, so you will need to work with us while we set up our supply chain and start receiving regular shipments.

For our regular and more significant users, who have standard colours and known ongoing requirements, this will not present a problem after their initial order arrives (about 10 weeks). For our smaller clients we will work with you and fit you in somehow.

Our plan is build an Australian manufacturing facility in Sydney within 12-18 months.

If you know anything about protective coatings you have to be excited!

- **Save up to 80% on your annualised cost of maintenance**
- Improve application efficiencies by up to 50%
- **Apply in 99% humidity and even at -15°C to 50°C**
- Single pack system to improve efficiencies and reduce wastage
- **Outstanding adhesion and >25% elasticity**
- 30 minute recoat intervals
- **Outperforms galvanic protection**
- Excellent maintenance over-coating option

Yours sincerely

Keith Mackenzie
