TILTEX 10B Rail Embankment Reconditioning Project

Tiltex 10B GCCM was specified as the ground surface erosion control over the embankments and drains for ARTC's Werris Creek Reconditioning Project. Safety, time management and a durable, low maintenance product were all critical elements of this project's success.

4,900m² of Tiltex 10B was supplied, installed and hydrated on steep batters during the rail possession. Over 60 x 5-metre-wide panel widths of Tiltex 10B were deployed by Tiltex Australia site personnel requiring over 1,090 lineal

metres of seam bonding. Our 5 metre wide rolls provided a 1/4 of the seaming requirements than other GCCM's.

Tiltex Australia tasked 2 teams to deploy Tiltex 10B with 2 personnel per team allocated to man a day shift and a night shift to meet the clients rail possession deadline. The project was completed safely with no injury downtime & ahead of schedule.
